Gas + Carbon -> Power Curve Implications | 18 June 2026

Today's Monitor Metrics

TTF Front-Month	EU Gas Storage Fill	EU ETS Carbon (EUA)	Clean Spark Spread	German Power DA	EU LNG Send-Out
40.74	45.29	75.38	39.82	139.92	3924.4
EUR/MWh	%	EUR/tonne	EUR/MWh	EUR/MWh	GWh/day

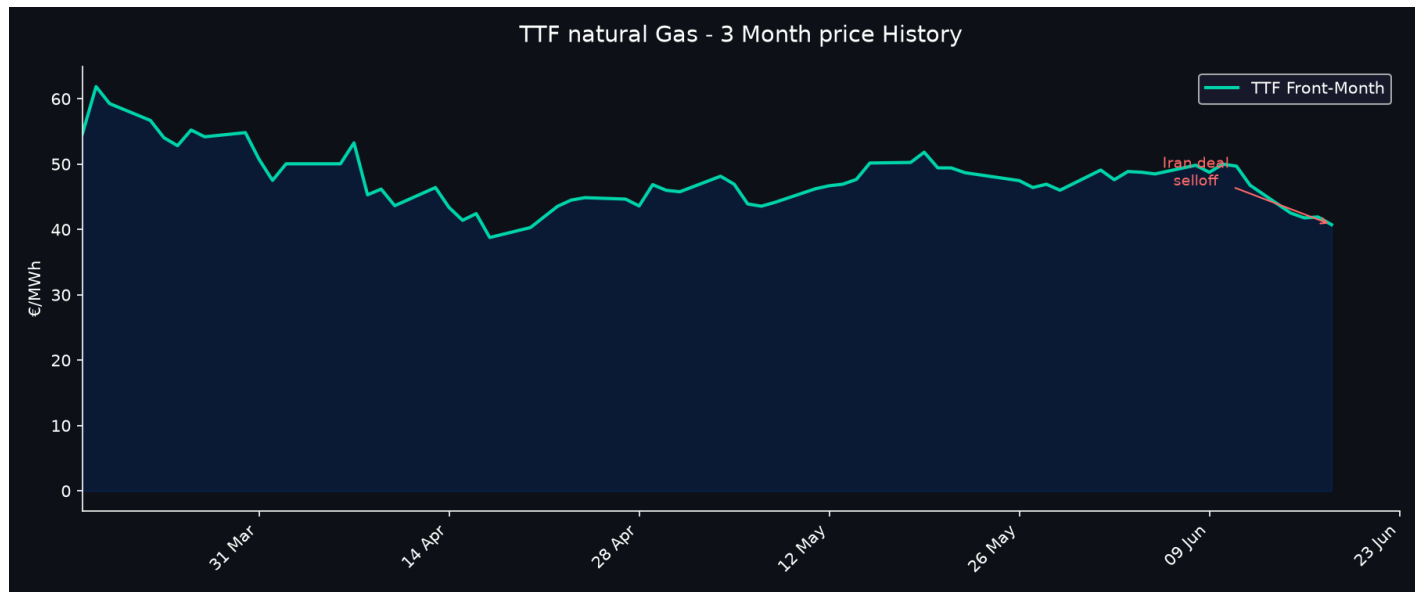

AI-Generated Trading Brief

European gas markets are showing signs of easing tightness, with TTF Front-Month down to 40.74 EUR/MWh, EU gas storage fill at 45.29%, and EU LNG send-out robust at 3924.4 GWh/day. This storage level is still significantly below last year's 51% at this time, but the recent TTF sell-off on potential reopened Strait of Hormuz trade suggests the market is pricing in some supply relief.

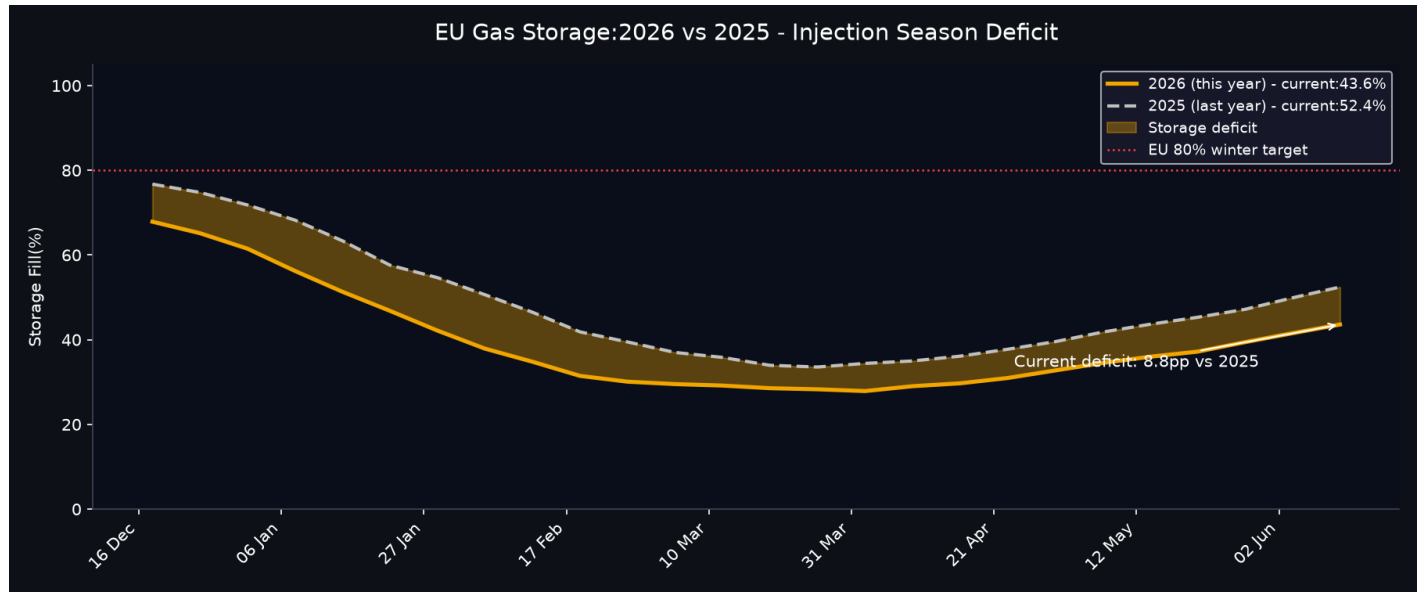

Carbon prices remain structurally supported at 75.38 EUR/tonne, driven by 2026 ETS reform and CBAM implementation, maintaining a high floor for emissions costs. The clean spark spread of 39.82 EUR/MWh indicates gas-fired power generation is currently profitable, which is further reinforced by the German Power DA price of 139.92 EUR/MWh.

Today's key risk to watch is any update on the US-Iran deal, as this could further impact TTF prices and gas market sentiment. Traders should be prepared for potential volatility in gas and power markets as the situation develops, with a focus on managing carbon risk and adjusting power curve positions accordingly.
